

Treponemal Diseases

Paul K. Shitabata, M.D.

Director of Dermatopathology

Harbor-UCLA Dermatology

The histopathologic spectrum of cutaneous syphilis infections includes:

- Granulomas
- Scarring alopecia
- Vasculitis
- Ulceration
- Psoriasiform dermatitis
- Lichenoid dermatitis

Answers

- All

Histopathological characteristics of Lyme disease include:

- Sclerosis
- Granulomatous neuritis
- Leukocytoclastic vasculitis
- Luminal thrombosis
- Mast cells
- Plasma cells

Answers

- Sclerosis
- Granulomatous neuritis
- Leukocytoclastic vasculitis
- Luminal thrombosis
- Plasma cells

Eosinophils, not mast cells, are usually abundant.
