

Tumors and Tumor-like Proliferations of Fibrous Tissue (Weedon Chapter 34)

Paul K. Shitabata, M.D.
Dermatopathology Institute

Name three other lesions that histologically resemble a fibrous papule (angiofibroma)

Answers

Adenoma sebaceum

Pearly penile plaques

Koenen's tumor

Examples of fibromatoses include all except:

- A. Dupuytren's disease
- B. Nodular fasciitis
- C. Peyronie's disease
- D. Desmoid tumor
- E. Pachydermodactyly

B-Nodular fasciitis

Characteristics of epithelioid sarcoma include all except:

- A. Predilection for elderly males
- B. Favors extremities
- C. Low power histopathology of a necrobiotic granuloma
- D. Tumor cells positive for cytokeratin, EMA, and vimentin
- E. Metastases in up to 45% of cases

Answer A

- This tumor has a predilection for young adult males.

Histopathological indicators of poor prognosis for a dermatofibrosarcoma protuberans include all except:

- A. Fibrosarcomatous transformation
- B. Incomplete surgical excision
- C. Bednar tumor
- D. Increased cellularity
- E. MF>8/10hpf

Answer C
