Woringer-Kolopp Disease (Pagetoid Reticulosis)
Notes

• This is a rare unilesional variant of mycosis fungoides, generally occurring in younger patients on the lower extremities

• Most common immunophenotype is CD4+, CD5-, CD7- but as in this case CD8+, CD7- cases have been reported.

• Rule out disseminated variant Ketron-Goodman Disease
Acral location with hyperkeratosis

Extensive epidermotropism by lymphocytes

Hyperchromatic enlarged and hyperconvoluted lymphocytes
